Abstract

Sustainable food systems play an important role in increasing resource efficiency, more sustainable use of resources, and building resilience in communities responding to a rapidly changing global environment. Sustainable diets’ notion links food consumption to production by taking into account nutritional requirements. The Decalogue for Sustainable Food and Nutrition in the Community provides a platform for community-based actions towards more sustainable diets, by reconnecting together within the community context the place of production and the space of consumption. This linkage between a dietary pattern and a geographic area has loosened with globalization. Within a period of radical transformation of the contemporary global scenario, the complexity of food security, nutrition and sustainability issues requires, within the people-centered development paradigm, new forms of community-based dialogues and actions. The Decalogue with its 10 points provides an operational ground for the development of meaningful discussions among communities towards a better understanding on how to integrate sustainability and food security and nutrition within their food systems. There is a need of more community-based sustainable food systems projects and intersectoral case studies for revitalizing local capacities. The Decalogue encourages the development of community-based projects and multi-stakeholder initiatives, such as the Island in Your Plate project, rooted in the cultural respect for the territory, in the sustainable management of natural resources, in the recognition and consumption of seasonal local products, and in the appreciation of the richness of local varieties and biodiversity. Connecting food security and sustainability to the nutritional well-being of the individual and of the community is the today challenge.

Keywords: Sustainable diets; Sustainable food systems; Food security and nutrition; Sustainability

Introduction

Population and income growth as well as urbanization are driving increased and changing food and feed demand. FAO estimates that in 2050, to satisfy the demand of a growing and richer population, with an increased meat demand, food production will have to increase by at least 60 percent in the next decades (Alexandratos, et al; 2012). Today, the main challenge for the food and agriculture sector is to simultaneously provide enough food – both in quantity and quality – to meet nutritional needs of all while conserving the natural resources to produce food for present and future generations. Despite the fact that the world is producing enough food to feed its entire population, almost 795 million people – representing about 12.9 percent of the population in developing regions – go hungry (FAO, IFAD and WFP; 2015); 161 million under-five year olds are estimated
Sustainable diets have emerged as a critical issue for sustainable systems and diets within the sustainable development agenda. The unsustainable nature of current diets. It has made, particular-

Sustainable food Systems
Food systems rely on a natural resource base that is becoming increasingly more fragile and scarce, and that is extremely vulnerable to climate change as well as biodiversity loss – both of which are undermining food security and nutrition (IPCC. Climate Change; 2014). Therefore, food systems have to become more efficient in their use of resources and increase resilience to environmental/climate-change related threats, at every stage, from primary production to transformation, distribution and consumption while relaying on a fragile and increasingly scarce resource base. Food system is defined as “a food system gathers all the elements (environment, people, inputs, processes, infrastructures, institutions, etc.) and activities that relate to the production, processing, distribution, preparation and consumption of food and the outputs of these activities, including socio-economic and environmental outcomes” (HLPE; 2014). Food systems play a key economic and social role in all societies and are fundamental to ensuring sustainable development; therefore, sustainable food systems are critical to improve food security and nutrition. A sustainable food system is defined as “a food system that delivers food security and nutrition for all in such a way that the economic, social and environmental bases to generate food security and nutrition for future generations are not compromised” (HLPE; 2014). Such a definition of sustainable food system entails the interconnectedness of all the food-related activities and the environment within which these activities occur. Further, it acknowledges that the production and consumption of food is a dynamic process involving multiple inputs, outputs and diverse stakeholders. In addition, it recognizes the diversity of food systems and their impacts, including from environmental, economic, social, health-related, ethical and cultural perspectives. Agro-food systems need to grow within the context of a finite and sometimes shrinking resource base and need to make use of the natural resources in a sustainable manner and conserve the ecosystem base. Such growth needs to be inclusive and target broader objectives than production and include efficiencies along the whole food chain and promote sustainable practices and sustainable dietary patterns.

Sustainable diets
There is growing recognition of the complexity of defining sustainability, as well as a growing body of evidence of the unsustainable nature of current diets. It has made, particular-

Reconnecting sustainable food production, food consumption and diets: The Decalogue for Sustainable Food and Nutrition in the Community.
Sustainability is presented in the Decalogue as an important aspect of the entire food chain process (production, transformation and distribution) for both plant and animal products. The environment is highlighted as usually more vulnerable to intensive production as to traditional systems of production, raising livestock and fishing, and therefore sustainable and harmonious food systems should be promoted. Therefore, by reconnecting together within the community context the place of production and the space of consumption the Decalogue provides a platform for community-based actions towards more sustainable diets. This linkage between a dietary pattern and a geographic area has loosened with globalization. With its 10 points, the Decalogue facilitates meaningful discussions among communities towards a better understanding on how to integrate sustainabili-

tion in the Decalogue is a fundamental element for the culture and identity of people. Therefore, the protection of gastronomic and cultural heritage in the community is seen in the Decalogue as a priority for the sustainability of food and nutrition in and of itself.

Within a period of radical transformation of the contemporary global scenario, the complexity of food security, nutrition and sustainability issues requires, within the people-centered development paradigm, new forms of community-based dialogues and actions. There is a need of more community-based sustainable food systems projects and intersectoral case studies for revitalizing local capacities. The Decalogue encourages the development of community-based projects and multi-stakeholder initiatives, such as the Island in Your Plate project, rooted in the cultural respect for the territory, in the sustainable management of natural resources, in the recognition and consumption of seasonal local products, and in the appreciation of the richness of local varieties and biodiversity.

Conclusions

Given the central role of food in the community, the Decalogue provides a platform for action towards the development of more community-based sustainable food production and consumption projects and initiatives which can play an integral part in embedding sustainability thinking and practice into everyday life of the community. The Decalogue can play an important advocacy role in the community by raising awareness of the need to shift to more sustainable food systems and by bring together initiatives and develop partnerships to build synergies and cooperation. The rethinking now being done in the international community requires a change of course, one that proceeds from bottom to top, to ensure effective, direct participation of local communities for a wiser use of available human and natural resources. Achieving this goal will require the active involvement of stakeholders across society and along the entire food supply chain. It will require multidisciplinary and multi-stakeholder initiatives, rooted in the respect for the territory and in the sustainable management of its natural and cultural resources, in the recognition and consumption of seasonal local products, and in the appreciation of its sustainable benefits on the health of individuals and communities, as well as on health of the planet. Connecting the nutritional well-being of the individual as well as of the community to the sustainability of our everyday living is the today challenge.
