Abstract
Polylactic-co-glycolic acid (PLGA) is a biodegradable copolymer. It has many applications in the pharmaceuticals and biomedical industries, but its degradation and stability is a major concern. The objective of this study was to evaluate the influence of the Trivedi Effect® on the physicochemical and thermal properties of PLGA using modern analytical techniques. The PLGA sample was divided into control and Biofield Energy Treated parts. The control sample did not obtain the Biofield Energy Treatment, whereas the treated PLGA was received the Trivedi Effect®-Consciousness Energy Healing Treatment remotely by a renowned Biofield Energy Healer, Alice Branton. The particle size values of the treated PLGA were increased by 8.97%(d₁₀), 8.79%(d₅₀), 4.72%(d₉₀), and 6.61%{D(4,3)}; thus, the surface area of treated PLGA was significantly decreased by 6.84% compared with the control sample. The latent heat of evaporation and fusion of the treated PLGA were significantly increased by 29.60% and 230.93%, respectively compared with the control sample. The residue amount was significantly increased by 21.99% in the treated PLGA compared to the control sample. The maximum thermal degradation temperature of the treated PLGA was increased by 2.30% compared with the control sample. It was concluded that the Trivedi Effect®-Consciousness Energy Healing Treatment might have generated a new form of PLGA which may show better powder flowability, thermal stability, and minimise the hydrolysis of the ester linkages of PLGA. This improved quality of PLGA would be a better choice for the pharmaceutical formulations (i.e., the drug like simvastatin, amoxicillin, and minocycline loaded PLGA nanoparticles) and manufacturing of biomedical devices, i.e., grafts, sutures, implants, surgical sealant films, prosthetic devices, etc., in the industry using it as a raw material.

Keywords: Polylactic-co-glycolic acid; The Trivedi Effect®; Consciousness energy healing treatment; Complementary and Alternative Medicine; PXRD; PSA; DSC; TGA/DTG

Introduction
Polylactic-co-glycolic acid (PLGA) is a synthetic copolymer of two different monomers, lactic acid, and glycolic acid. It has a great deal of attention in research and development as an alternative biodegradable polymer which has constant biodegradation rate, mechanical resistance, and regular individual chain geometry[1]. PLGA on hydrolysis of its ester linkages in the presence of water releases the monomers. These two monomers under normal physiological conditions are the by-products of various metabolic pathways in the body, hence minimum systemic toxicity. Higher the content of glycolide units in the PLGA, lower the time required for degradation. PLGA is a choice in the manufacturing of biomedical devices, i.e., grafts, sutures, implants, surgical sealant films, prosthetic devices, micro and nanoparticles[2]. Specifically, PLGA is more useful for the designing of better pharmaceuticals formulations, i.e., the drug like simvastatin, amoxicillin, vancomycin, and minocycline loaded PLGA nanoparti-
cles could be effective in sustaining drug release for a prolonged period[3-5]. The PLGA containing less than 50% glycolic acid units is soluble in most common organic solvents, such as chloroform, dichloromethane, ethyl acetate, dioxane, acetone, and tetrahydrofuran. However, PLGA rich in glycolyl units 50% and higher is insoluble in most organic solvents[6,7]. In the absence of moisture, it has adequate heat stability[8]. The degradation and stability of PLGA is a major concern, which completely depends upon the monomer distribution pattern, chain-ends chemical composition, porosity, size, shape, and presence of additives (i.e., acidic/basic compounds, plasticizers, or drugs), moisture, and temperature[9-11].

Many Scientific study on the Trivedi Effect® (Biofield Energy Healing Treatment) has been claimed to have the significant influence on the physicochemical, thermal, and behavioural properties (crystallite size, particle size, surface area, solubility, melting point, latent heat, etc.) of various object(s)[12-14]. The Trivedi Effect® is a natural and only scientifically proven phenomenon in which a person can harness this inherently intelligent energy from the Universe and transmit it anywhere on the planet through the possible mediation of neutrinos[15]. There is a unique para-dimensional electromagnetic field generated from the continuous movement of the electrically charged particles (i.e., ions, cells, etc.) inside the body. This electromagnetic field (A Putative Energy Field) exists around the body of every living organism known as the “Biofield”. The Biofield Energy Healers have the ability to harness the energy from the Universe and can transmit into any living or non-living object(s) around the earth. All over the world the Biofield based Energy Healing Therapies have been accepted and reported in many scientific journals with significant outcomes against various disease conditions[16-17]. The Biofield Energy Healing therapy has been recognized as a Complementary and Alternative Medicine (CAM) health care approach by the National Center of Complementary and Integrative Health (NCCIH) with other therapies, medicines and practices such as yoga, Tai Chi, Qi Gong, homeopathy, chiropractic/osteopathic manipulation, meditation, acupressure, acupuncture, healing touch, hypnotherapy, movement therapy, naturopathy, Ayurvedic medicine, cranial sacral therapy, traditional Chinese herbs and medicines, aromatherapy, Reiki, etc., that has been accepted by the most of the U.S. population[18,19]. The Trivedi Effect®-Consciousness Energy Healing Treatment (Biofield Energy Healing Treatment) also reported with their significant outcomes in different field of sciences i.e., material science[20,21], organic chemistry[22,23], nutraceutical/pharmaceutical sciences[24,25], biotechnology[26,27], microbiology[28,29], agriculture[30,31], and medical science[32,33]. Therefore, the study was designed to evaluate the influence of the Trivedi Effect®-Consciousness Energy Healing Treatment on PLGA using powder X-ray diffraction (PXRD), particle size analysis (PSA), differential scanning calorimetry (DSC) analytical techniques, and thermogravimetric analysis (TGA)/Differential thermogravimetric analysis (DTG).

Materials and Methods

Chemicals and Reagents

The polylactic-co-glycolic acid (PLGA, 70:30) powder was purchased from Changchun Hang Gai Biological Technology Co., Ltd., China. All other chemicals used during the experiments were of analytical grade available in India.

Consciousness Energy Healing Treatment Strategies

The test sample PLGA powder was divided into two parts. One part of the test sample was treated with the Trivedi Effect®-Consciousness Energy Healing Treatment remotely under standard laboratory conditions for 3 minutes and known as a Biofield Energy Treated PLGA sample. The Biofield Energy Treatment was provided through the healer’s unique energy transmission process by the renowned Biofield Energy Healer, Alice Brandon, USA, to one part of the test PLGA sample. Subsequently, the other part of the test sample was considered as a control/un-treated sample (Biofield Energy Treatment was not provided). Further, the control sample was treated with a “sham” healer for the comparison with the analytical results of the Biofield Energy Treated PLGA sample. The “sham” healer did not have any knowledge about the Biofield Energy Treatment. After all, the Biofield Energy Treated and untreated PLGA samples were kept in the sealed conditions and characterized using PXRD, PSA, DSC, and TGA analytical techniques.

Characterization

The PSA, PXRD, DSC, and TGA analysis of PLGA were performed. The PXRD analysis of PLGA powder sample was performed with the help of Rigaku MiniFlex-II Desktop X-ray diffractometer (Japan)[34,35]. The average size of crystallites was calculated from PXRD data using the Scherrer’s formula (1)

\[ G = \frac{k\lambda}{β\cosθ} \]  

(1)

Where G is the crystallite size in nm, k is the equipment constant (0.94), λ is the radiation wavelength (0.154056 nm for Kα1 emission), β is the full-width at half maximum, and θ is the Bragg angle[36].

The PSA was performed using Malvern Mastersizer 2000, from the UK with a detection range between 0.01 μm to 3000 μm using the wet method. Similarly, the DSC analysis of PLGA was performed with the help of DSC Q2000, TA instruments. The TGA/DTG thermograms of PLGA were obtained with the help of TGA Q50 TA instruments[37,38].

The % change in particle size, specific surface area (SSA), peak intensity, crystallite size, melting point, latent heat, weight loss and the maximum thermal degradation temperature (T_{max}) of the Biofield Energy Treated sample was calculated compared with the control sample using the following equation 2:

\[ \% \text{change} = \left( \frac{\text{Treated} - \text{Control}}{\text{Control}} \right) \times 100 \]  

(2)

Results and Discussion

Powder X-ray Diffraction (PXRD) Analysis

PXRD study of the control and Biofield Energy Treated PLGA was performed to determine the crystalline pattern of the samples. The PXRD experimental results of the control and Biofield Energy Treated PLGA samples did not show sharp and intense peaks in the respective diffractograms (Figure 1). Thus, it was concluded that both samples were amorphous in nature and the Biofield Energy Treatment might not affect the crystallinity and pattern of the PLGA.

Biofield Energy Treated PLGA at 3 and 451.581 µm, respectively. Similarly, the particle sizes of the compound may help in enhancing the shape, appearance, and flowability of the PLGA sample. The increased particle size of a compound can reduce the internal molecular energy for increasing the particle size of PLGA.

**Differential Scanning Calorimetry (DSC) Analysis**

The thermal analysis of both control and Biofield Energy Treated samples has been performed to evaluate the impact of the Trivedi Effect® on the thermal behavior of PLGA. The thermograms of both the samples showed two endothermic peaks. The control PLGA sample showed the sharp endothermic peaks at 60.94°C and 335.11°C in the thermogram (Figure 2). Similarly, the Biofield Energy Treated PLGA sample showed the sharp endothermic peaks at 60.95°C and 328.4°C in the thermogram (Figure 2). The 1st endothermic peak was due to the evaporation of the trapped water molecule from the sample, whereas the 2nd large endothermic pick was due to the melting of PLGA. The observed DSC thermograms patterns were well matched with the literature data[1].

Thermal Gravimetric Analysis (TGA)/ Differential thermogravimetric analysis (DTG)

The TGA/DTG thermograms of the control and Biofield Energy Treated PLGA samples are displayed in Figures 3 and 4. Both the thermograms showed one step of the degradation process. The total weight loss in the Biofield Energy Treated PLGA (96.39%) was decreased by 0.67% compared with the control sample (97.04%). Therefore, the residue amount was 21.99% more in the Biofield Energy Treated PLGA compared to the control sample (Table 3).

Similarly, the DTG thermograms of the control and Biofield Energy Treated PLGA exhibited one sharp peak (Figure 4). The maximum thermal degradation temperature ($T_{\text{max}}$) of the Biofield Energy Treated PLGA was increased by 2.30% compared with the control sample. Overall, TGA/DTG thermal analysis revealed that the thermal stability of the Biofield Energy Treated PLGA was increased compared with the control sample.

Conclusions

The Trivedi Effect®-Consciousness Energy Healing Treatment have a significant impact on the particle size, surface area, and thermal behaviors of PLGA. The particle size values of the Biofield Energy Treated PLGA powder sample at $d_{10}$, $d_{50}$, $d_{90}$, and $D(4,3)$ were increased by 8.97%, 8.79%, 4.72%, and 6.61%, respectively compared to the control sample. Therefore, the surface area of the Biofield Energy Treated PLGA was significantly decreased by 6.84% compared with the control sample. The $\Delta H_{\text{evaporation}}$ and $\Delta H_{\text{fusion}}$ of the Biofield Energy Treated PLGA were significantly increased by 29.60% and 230.93%, respectively compared with the control sample. The residue amount
was 21.99% more in the Biofield Energy Treated PLGA compared to the control sample. The T_max of the Biofield Energy Treated PLGA was increased by 2.3% compared with the control sample. The Trivedi Effect®-Consciousness Energy Healing Treatment might have introduced a new polymorphic form of PLGA which may show better powder flowability and minimise the hydrolysis of the ester linkages of PLGA. This improved quality of PLGA would be a better choice for the pharmaceutical formulations (i.e., the drug like simvastatin, amoxicillin, vancomycin, and minocycline loaded PLGA nanoparticles) and manufacturing of biomedical devices, i.e., grafts, sutures, implants, surgical sealant films, prosthetic devices, micro and nanoparticles in the industry using it as a raw material.
